

Index

- enum class (cont.)
 - use cases (cont.)
 - namespace pollution, avoiding, 339–340
 - overloading disambiguation, 340–343
 - weakly typed C++03 enumerators, draw-
backs to, 333–335
 - enumerations. *See also* opaque enumerations
 - comparisons in C++20, 335n1
 - underlying types (UTs)
 - description of, 829–830
 - further reading for, 834
 - potential pitfalls, 832–833
 - use cases, 830–832
 - enumerators, as compile-time constants, 164
 - errors
 - compiler warnings as, 150
 - compile-time, 22
 - escalation, 374
 - essential behavior, 102
 - event-driven callbacks, 603–604
 - exception agnostic, 644, 1126
 - exception-free path, 1134, 1136, 1143
 - exception safe, 644, 1126
 - exception specifications, 593. *See also* **noexcept**
 - exception specifications
 - conditional, 1091–1092
 - constraints in class hierarchies, 655–658
 - dynamic, 618–619
 - function types and, 1147–1148
 - text-segment size comparison, 1108
 - type system and, 1089n5
 - unconditional, 1085–1089
 - violating, 1093
 - exceptions, 615–618, 1104
 - excess *N* notation, 155
 - executable images, 1135
 - execution character sets, 844
 - expansion. *See* pack expansion
 - expiring objects, 741–742, 749
 - expiring value
 - rvalue references, 712–713
 - xvalues*, 721–723
 - explicit class APIs, 38–39
 - explicit constructors, passing multiple arguments,
250–252
 - explicit conversion operators
 - description of, 61–63
 - potential pitfalls, 66–67
 - use cases, 63–65
 - explicit instantiation declarations
 - annoyances, 373–375
 - member validity, 374–375
 - unrelated class definitions, 373–374
 - description of, 353–365
 - further reading for, 376
 - illustrative example, 355–359
 - .o files, effect on, 359–365
 - potential pitfalls, 371–373
 - corresponding explicit-instantiation
declarations and definitions, 371–372
 - pessimization over optimization, 373
 - use cases, 365–370
 - insulation from client code, 369–370
 - reducing code bloat in object files, 365–
369
- explicit instantiation definitions, 353–355, 358–359,
363, 370–375
- explicit instantiation directives, 353n1, 354–355,
369, 375
- explicit template argument specifications, 895
- explicit typenames, 26–27
- explicitly captured, 582–583
- explicitly copied, 583
- explicitly declaring special member functions, 33–
34
- exporting bitwise copies of PODs, 479–480
- expression alias, 1146–1147
- expression SFINAE, 29n3, 122, 126
- expression templates, 202–203
- expressions. *See also* lambda expressions
 - compound, **noexcept** operator and, 626–627
 - decltype** use with, 25–26
 - decomposing complex, 391–393
 - rvalue references in, 730–731
 - validation of, 28–30
- extended alignment, 168–170
- extended **friend** declarations. *See* **friend** decla-
rations
- extended **typedef**. *See* aliases
- extern template**
 - annoyances, 373–375
 - member validity, 374–375
 - unrelated class definitions, 373–374
 - description of, 353–365
 - further reading for, 376
 - illustrative example, 355–359
 - .o files, effect on, 359–365
 - potential pitfalls, 371–373
 - corresponding explicit-instantiation
declarations and definitions, 371–372
 - pessimization over optimization, 373
 - use cases, 365–370
 - insulation from client code, 369–370
 - reducing code bloat in object files, 365–
369
- external definitions for static member variables,
314–315
- external linkages, 307
- external static analysis, control of, 17–18
