

## Index

- lambda expressions
  - annoyances, 611–614
    - capturing **\*this** by copy, 611–612
    - debugging, 611
    - mixing immediate and deferred-execution code, 612–613
    - trailing punctuation, 613–614
  - configuring algorithms via, 86–87
  - decltype(auto)** placeholders and, 1206
  - deduced return types for, 1189–1190, 1197–1198
  - description of, 573–597
  - further reading for, 614
  - generic lambdas
    - annoyances, 981–984
    - description of, 968–975
    - further reading for, 985
    - potential pitfalls, 981
    - use cases, 975–981
  - local/unnamed types, 83–84
  - parts of, 577–578
    - closures, 578–581
    - lambda body, 595–597
    - lambda captures, 581–591
    - lambda declarators, 591–595
    - lambda introducers, 581–591
  - potential pitfalls, 607–611
    - dangling references, 607–608
    - local variables in unevaluated contexts, 610–611
    - mixing captured and noncaptured variables, 609
    - overuse, 609
  - use cases, 597–607
    - emulating local functions, 598–599
    - emulating user-defined control constructs, 599–600
    - event-driven callbacks, 603–604
    - interface adaptation, partial application, currying, 597–598
    - recursion, 604–605
    - stateless lambdas, 605–607
    - with `std::function`, 601–603
    - variables and control constructs in expressions, 600–601
- lambda introducers, 581–591, 986
- lambda-capture expressions. *See also* **auto** variables; braced initialization; forwarding references; lambda expressions; rvalue references
  - annoyances, 993–994
    - difficulty of synthesizing **const** data members, 993–994
    - `std::function` supports only copyable callable objects, 994
  - description of, 986–988
  - further reading for, 995
  - potential pitfalls, 992–993
  - use cases, 988–992
    - capturing modifiable copy of **const** variable, 990–992
    - moving objects into closure, 988–989
    - providing mutable state for closure, 989–990
- lambda-capture list, 919–921
- language undefined behavior, 1115
- libraries
  - Guidelines Support Library*, 17
  - Ranges** Library, 391–393, 686n4, 687n5
  - resilience to code changes, 203
- library undefined behaviors, 1115
- lifetime extensions, 1162, 1213
  - prvalues*, 720
  - range-based **for** loops, 680, 691–696
  - temporary objects, 819–820
- limerick in C++ Language Standard, 1081–1082
- linear search in variadic templates, 957
- `linearInterpolation` function, 16–17
- linkage, 83
- link-safe ABI versioning, 1067–1071
- link-time optimization, 1094, 1143
- Liskov, Barbara, 1026, 1030
- Liskov Substitution **Principal** (LSP), 1030
- list initialization
  - braced initialization and, 215, 233–234
  - deducing, 210–211
- list initialized literal types, 260
- literal types, 278–284
  - aggregate types as, 279–280
  - array types as, 280
  - compile-time constructible, 462–464
  - in constant expressions, 260–261, 273, 277–278
  - constexpr** constructors and, 281
  - cv-qualifiers as, 280
  - identifying, 282–284
  - pointers as, 281
  - reference types as, 279
  - scalar types as, 278
  - `std::initializer_list`, 556
  - `std::is_literal_type`, 283n14
  - trivially destructible types as, 431
  - user-defined, 280
  - variable templates of, 302
  - void** return type as, 280
- literals
  - binary
    - description of, 142–143
    - further reading for, 146
    - use cases, 144–146
