

extern template

Chapter 2 Conditionally Safe Features

```

extern template class FixedArray<int, 3>;           // class template
extern template int dot(const FixedArray<int, 3>& a,    // function template
                      const FixedArray<int, 3>& b); // for int and 3

extern template class FixedArray<double, 2>;        // for double and 2
extern template double dot(const FixedArray<double, 2>& a,
                           const FixedArray<double, 2>& b);

extern template class FixedArray<double, 3>;        // for double and 3
extern template double dot(const FixedArray<double, 3>& a,
                           const FixedArray<double, 3>& b);

} // Close game namespace

#endif // INCLUDED_GAME_FIXEDARRAY

```

Specializations commonly used by the `game` project are provided by the `game` library. In the component header in the example above, we have used the **extern template** syntax to suppress object-code generation for instantiations of both the class template `FixedArray` and the function template `dot` for element types `int` and `double`, each for array sizes 2 and 3. To ensure that these specialized definitions are available in every program that might need them, we use the **template** syntax counterpart to *force* object-code generation within just the one .o corresponding to the `game_fixedarray` library component⁴:

```

// game_fixedarray.cpp:
#include <game_fixedarray.h> // included as first substantive line of code

// Explicit-instantiation definitions for full template specializations
// commonly used by the game project are provided below.

template class game::FixedArray<int, 2>;           // class template
template int game::dot(const FixedArray<int, 2>& a,    // function template
                      const FixedArray<int, 2>& b); // for int and 2

template class game::FixedArray<int, 3>;           // class template
template int game::dot(const FixedArray<int, 3>& a,    // function template
                      const FixedArray<int, 3>& b); // for int and 3

template class game::FixedArray<double, 2>;        // for double and 2
template double game::dot(const FixedArray<double, 2>& a,
                           const FixedArray<double, 2>& b);

```

⁴Notice that we have chosen *not* to nest the explicit specializations — or any other definitions — of entities already declared directly within the `game` namespace, preferring instead to qualify each entity explicitly to be consistent with how we render free-function definitions to avoid self-declaration; see *lakos20*, section 2.5, “Component Source-Code Organization,” pp. 333–342, specifically Figure 2-36b, p. 340. See also *Potential Pitfalls — Corresponding explicit-instantiation declarations and definitions* on page 371.
